

EXPANDED POLYSTYRENE SOLUTIONS

STYRO Floor Raising System

STYRO Floor Raising System is a unique solution for raising the floor level in buildings. It consists of lightweight expanded polystyrene (EPS) blocks that are installed on the existing floor and covered with a layer of screed with reinforcement to create a new level surface. It allows you to use any finishing material, such as tiles or parquet, to be installed on top of the concrete surface to achieve the desired look for the floor.

The system is used in various construction projects, including residential and commercial buildings, high-rise buildings, swimming pools, malls, showrooms and themed parks. This is an ideal solution for resolving problems such as uneven floors.

Watch the Video

✓ Lightweight:

It reduces the load on the existing structure, preventing further damage. It also makes it easier to handle and install, reducing the installation time and labour costs.

✓ Cost Effective:

It reduces the overall cost of the repair or renovation project as well as saves money on materials, labour and other expenses, making it a budget-friendly option.

✓ Easy to Install:

It reduces the installation time, minimizing disruptions to your daily activities. An easy-to-install solution also reduces the need for heavy equipment or specialized labor, making it a more accessible option.

✓ Flexible in Design:

It allows you to create a custom solution that meets your specific needs. With a flexible design, you can create unique curves, shapes and slopes to match your existing flooring or to create a new design aesthetic.

✓ High Compressive Strength:

It can withstand heavy loads and high traffic areas without cracking or breaking. A lightweight system with high compressive strength ensures that the flooring remains stable and safe for use, reducing the need for future repairs or replacements.
